

ALMA WebLog Review

George Bendo

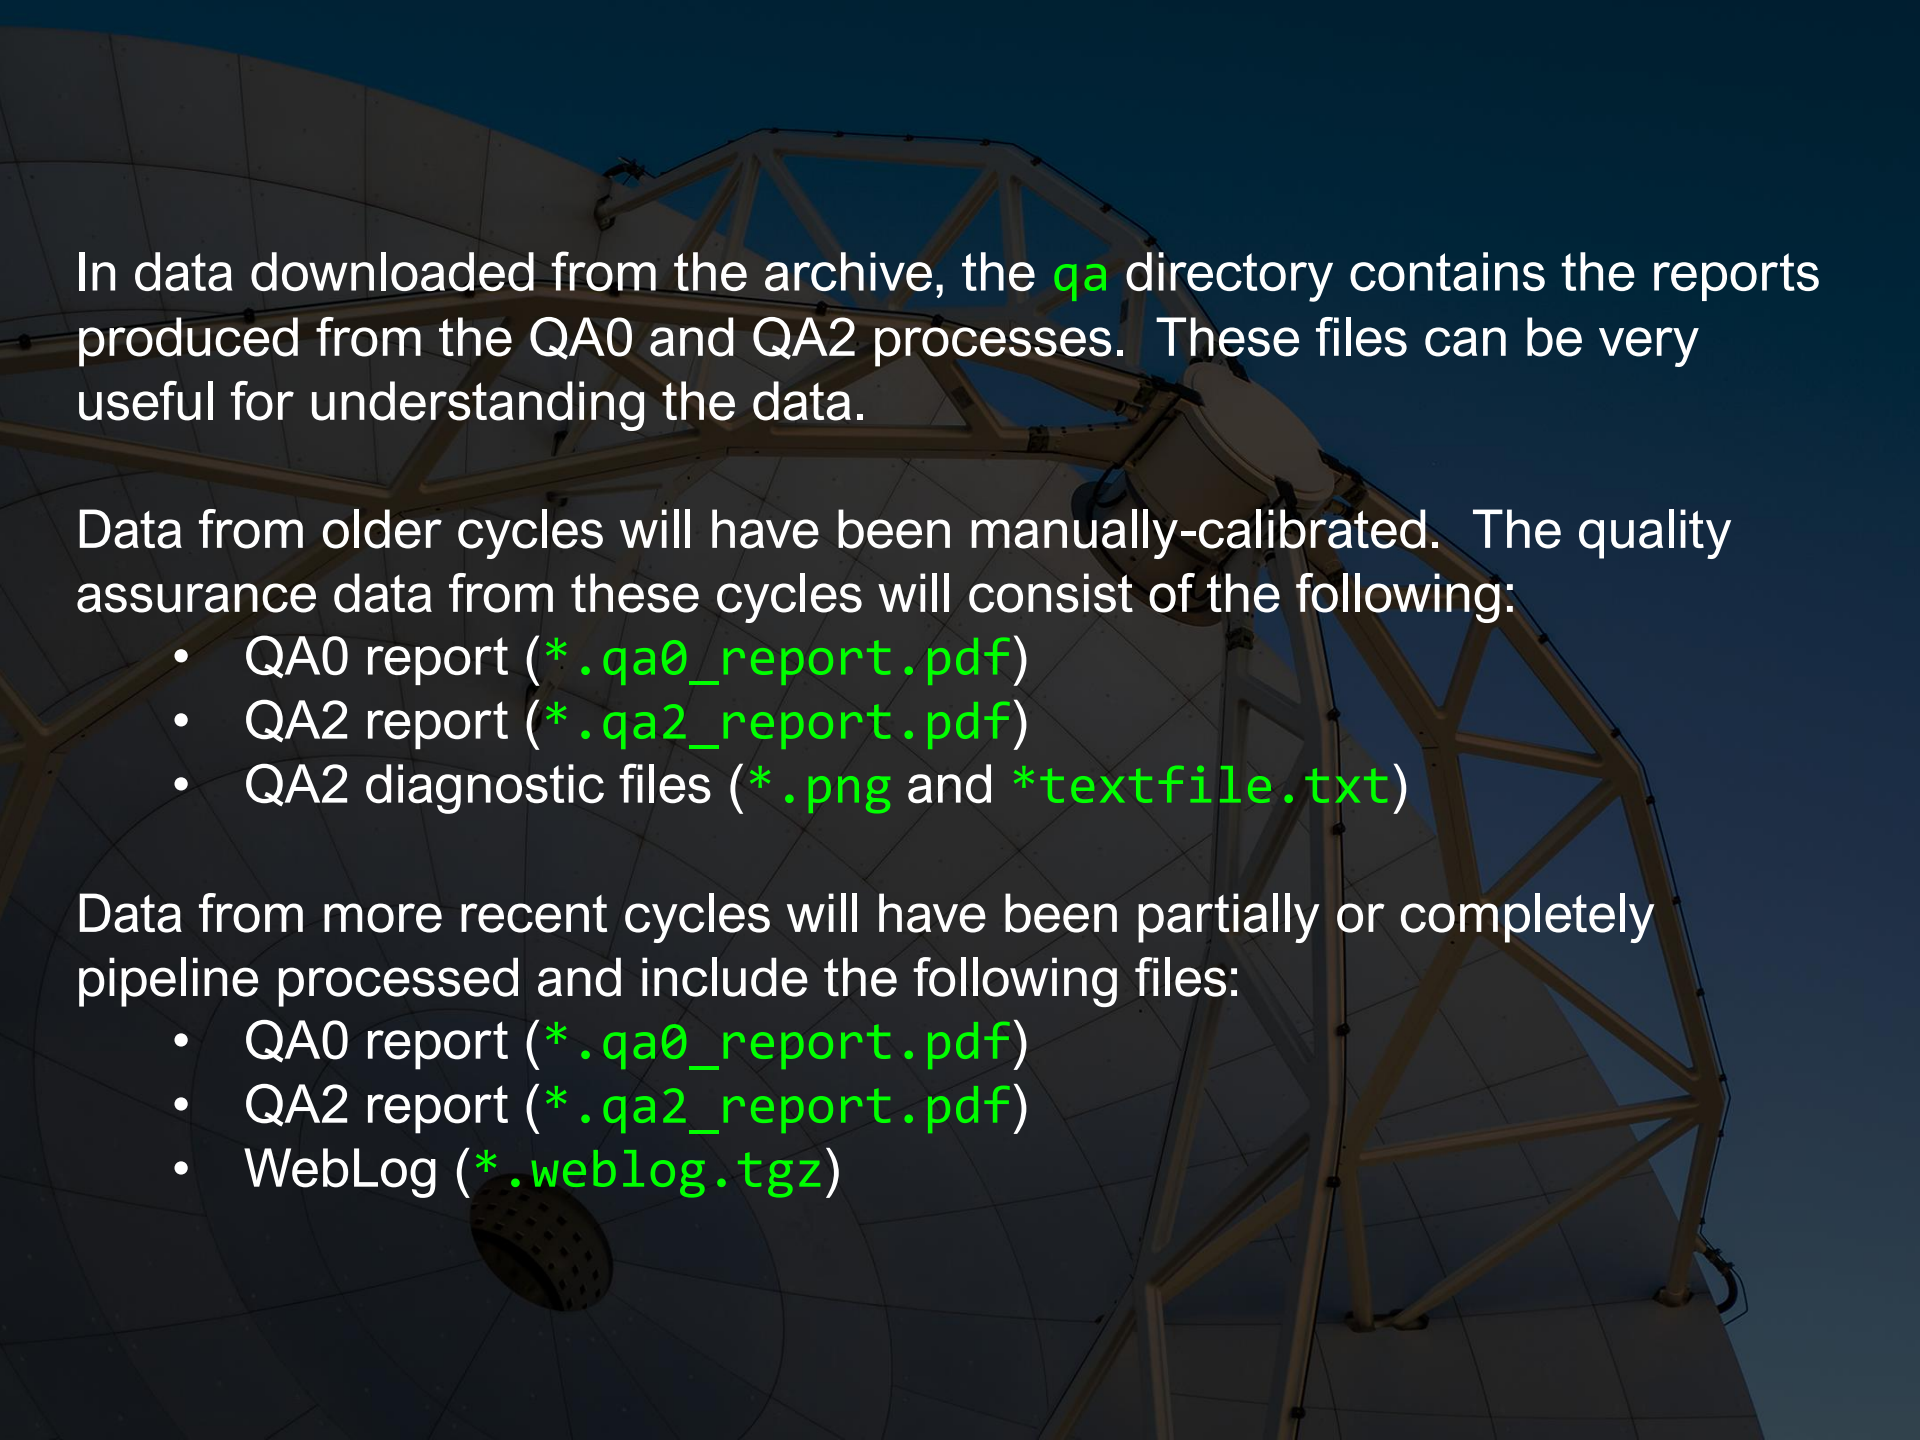

UK ALMA Regional Centre Node
Jodrell Bank Centre for Astrophysics
The University of Manchester

In the context of ALMA, QA stands for quality assurance. ALMA has four phases of quality assurance:

- QA0 Simple quality checks performed at the observatory as soon as the data are acquired
- QA1 Long-term monitoring of the performance of the observatory (not specific to any project)
- QA2 A complete quality assessment performed on the data after completely calibrating and imaging the data
- QA3 Re-assessment of data after they are delivered to users triggered when someone discovers a previously-unidentified problem

In data downloaded from the archive, the `qa` directory contains the reports produced from the QA0 and QA2 processes. These files can be very useful for understanding the data.

Data from older cycles will have been manually-calibrated. The quality assurance data from these cycles will consist of the following:

- QA0 report (`*.qa0_report.pdf`)
- QA2 report (`*.qa2_report.pdf`)
- QA2 diagnostic files (`*.png` and `*textfile.txt`)

Data from more recent cycles will have been partially or completely pipeline processed and include the following files:

- QA0 report (`*.qa0_report.pdf`)
- QA2 report (`*.qa2_report.pdf`)
- WebLog (`*.weblog.tgz`)

The QA0 PDF provides a summary of comments from the astronomer who acquired the data. Each Execution Block (EB) will have its own report.

Versions of this document from earlier cycles contain just some simple diagnostic plots.

Versions from recent cycles contain several new sets of diagnostic plots as well as preview images.

These documents are most useful for understanding whether any problems were encountered during the observations.

QA0 Report 

Execution Block Summary

Project Code	2022.1.00401.S	SchedBlock	PN_Hb_5_a_06_TM2
ExecBlock	uid://A002/X1003af4/Xa540	ExecBlock Status	SUCCESS
QA0 Status	✔ Pass	Exec. Fraction	1.47
Repr. frequency	230.560 GHz (Sky)	Band	ALMA_RB_06
Array	12 [m]	Baselines	14m -- 312m
Antennas	Antennas: 43 effective, 43 usable, 43 unflagged, 43 total. Expected for Cycle 9 : 43, minimum acceptable: N/A Band observed: 6. Highest recommended: 7-7		
Weather	PWV 1.23 mm; Wind 9.80 m/s; Humidity 13.53 %; Pressure 445.58 hPa; Phase rms: 72.605 microns		
QA0 comment	No major issues. Pass.

L80 resolution: 1.571 arcsec Bandpass calibrator: J1924-2914 Flux: 6.925 +/- 0.230 Jy Possible channels with SNR>30: 3694 Phase calibrator: J1820-2528 Flux: 0.297 +/- 0.014 Jy Sky separation: 9.00 degrees Resolution slope : 0.00 SNR in calibrated phaseCal flux: Between antennas: 37.2 Between scans: 136.2 1 completed cycles of science/phaseCal. 1 bandpass scan Percentage of antenna/bb data flagged: 0.00% Binary size: 5.93GB Band observed: 6 HIGHEST RECOMMENDED OBSERVING BAND: 7 - 7 *** QA0 PASS		
QA0 warnings	Achieved angular resolution is outside the expected range. Observed: 1.12, requested: 1.17 - 1.76		

Page 1 of 17

The QA0+ section shows some very quick (but very rough) images produced from the data soon after the observations were performed as well as some measurements from those images.

While these images and data are useful for providing a preliminary view of the results, they may be inaccurate compared to what is in the WebLogs.

QA0+ EB

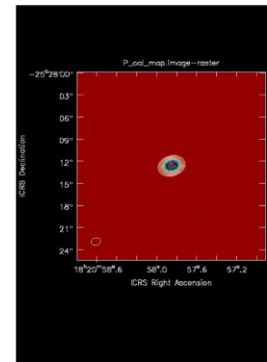

QA0+ results are only to be used as a guide to assess the data quality, and are not for scientific use. QA0+ image and fluxes are obtained from an online reduction of the combined wideband continuum spectral windows (using mfs TCLEAN in CASA), with no bandpass or Tsys calibration, nor removal of potential line contamination. Fluxes are only approximate. 'QA0+ EB' is the result from concatenating all EBs up to the current one.

Science target	NGC_6445				
Peak	6.112	Integrated	40.478	RMS	0.351

The QA0+ section shows some very quick (but very rough) images produced from the data soon after the observations were performed as well as some measurements from those images.

While these images and data are useful for providing a preliminary view of the results, they may be inaccurate compared to what is in the WebLogs.

Phase Cal (left).

Target images

The QA2 PDF includes some comments on the data processing and summary information about the observations.

The last few pages of the document include standard instructions sent to all users.

The first part of the section under "Final QA2 comment" may be useful to read in case something went wrong with the observations.

Execution count 1.47 of 1 expected

Final QA2 comment

Calibration issues: None.

Imaging issues: None.

It is recommended that the PI carefully assess the results on the hif_findcont weblog page, and the "line-free moment 8" images on the cube imaging weblog page.

Self-calibration was not performed.

This dataset has been checked for the so-called "renormalization issue". A detailed description about this issue, and how the renormalization process is carried out, can be found at the following link: <https://help.almascience.org/kb/articles/what-are-the-amplitude-calibration-issues-caused-by-alm-a-s-normalization-strategy>

The requirement of rescaling due to any astronomical lines detected in this dataset has been evaluated and the largest peak rescaling value has been estimated to be 5.4 %, as displayed in the table in the hifa_renorm task of the delivered weblog. The effect of rescaling is a channel-dependent increase of the line flux, which is largest in the brightest channels.

This is not an increase in flux-scale uncertainty, but a flux offset correction. When comparing such an offset to the nominal absolute flux accuracy, which is 5% in Bands 3, 4 & 5 and increasing to 20% in Bands 9 & 10, it is concluded that offsets up to 2% are considered negligible.

Since the rescaling factor is above this threshold, this dataset has been corrected for the above issue.

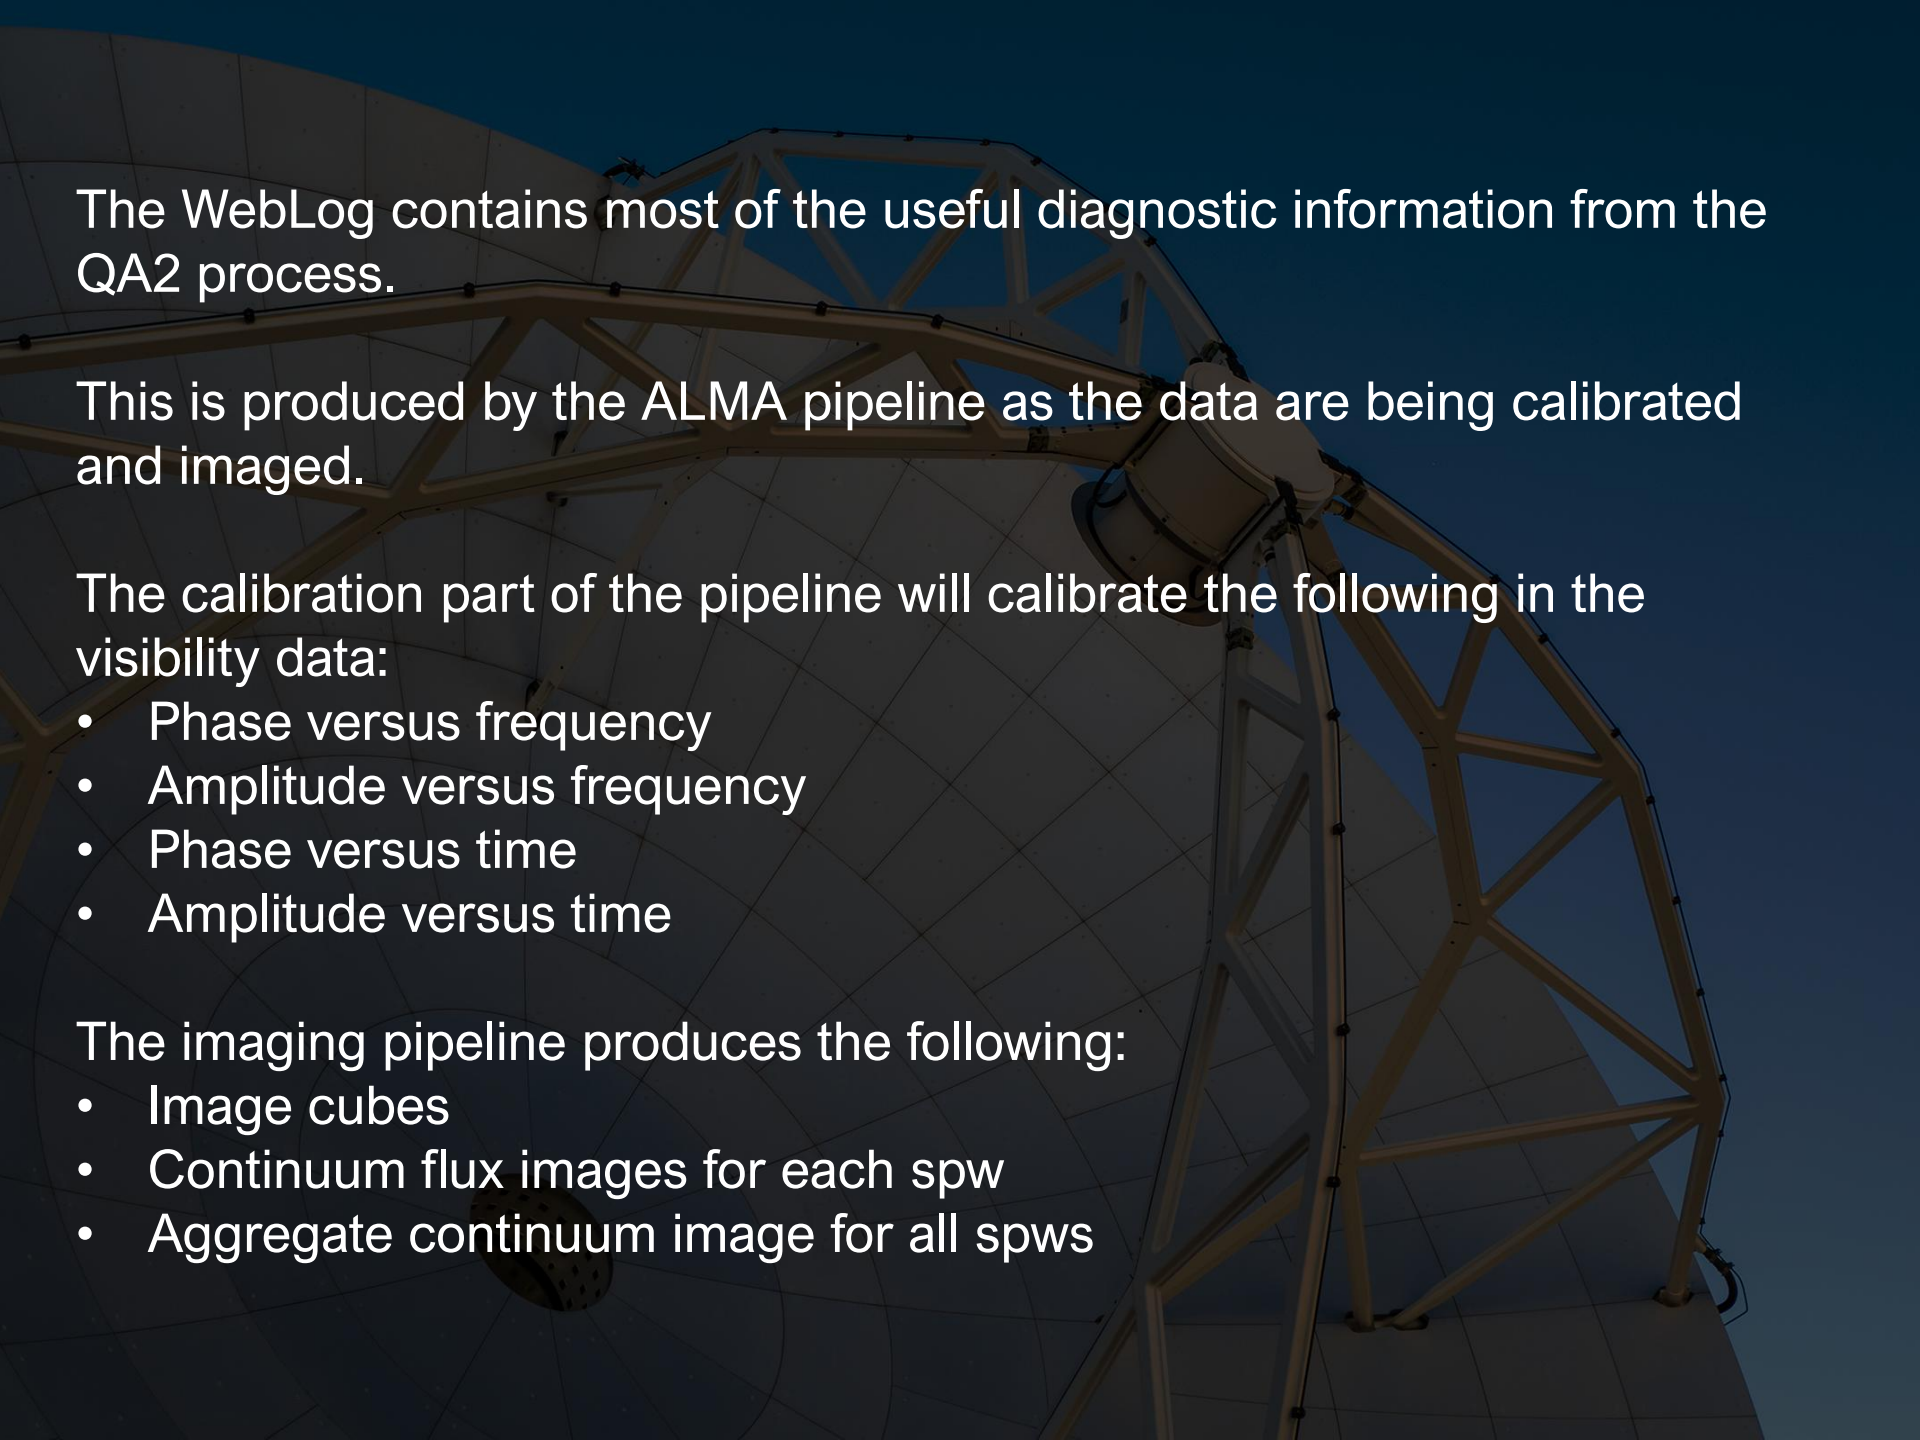

QA2 was performed on the image whose channel width is the one closest to the representative bandwidth selected by the PI in ALMA OT, in the spectral window closest in frequency to the representative frequency. Both the beam size and the RMS meet the PI requested performance parameters. Therefore, this scheduling block has been deemed a QA2 PASS.

Representative Window - spw 27

Image name: uid__A001_X2d20_X2bb8.s40_0.PN_Hb_5_sci.spw27.repBW.l.iter1.image
Robust = 0.5
Beam size = 1.60 x 1.15 arcsec
RMS = 5.65 mJy/beam over an effective bandwidth 2.71 MHz

Aggregate Continuum -

Image name: uid__A001_X2d20_X2bb8.s36_0.PN_Hb_5_sci.spw25_27_29_31.cont.l.iter1.image
Robust = 0.5
Beam size = 1.49 x 1.04 arcsec
RMS = 0.33 mJy/beam over 2.51 GHz

The WebLog contains most of the useful diagnostic information from the QA2 process.

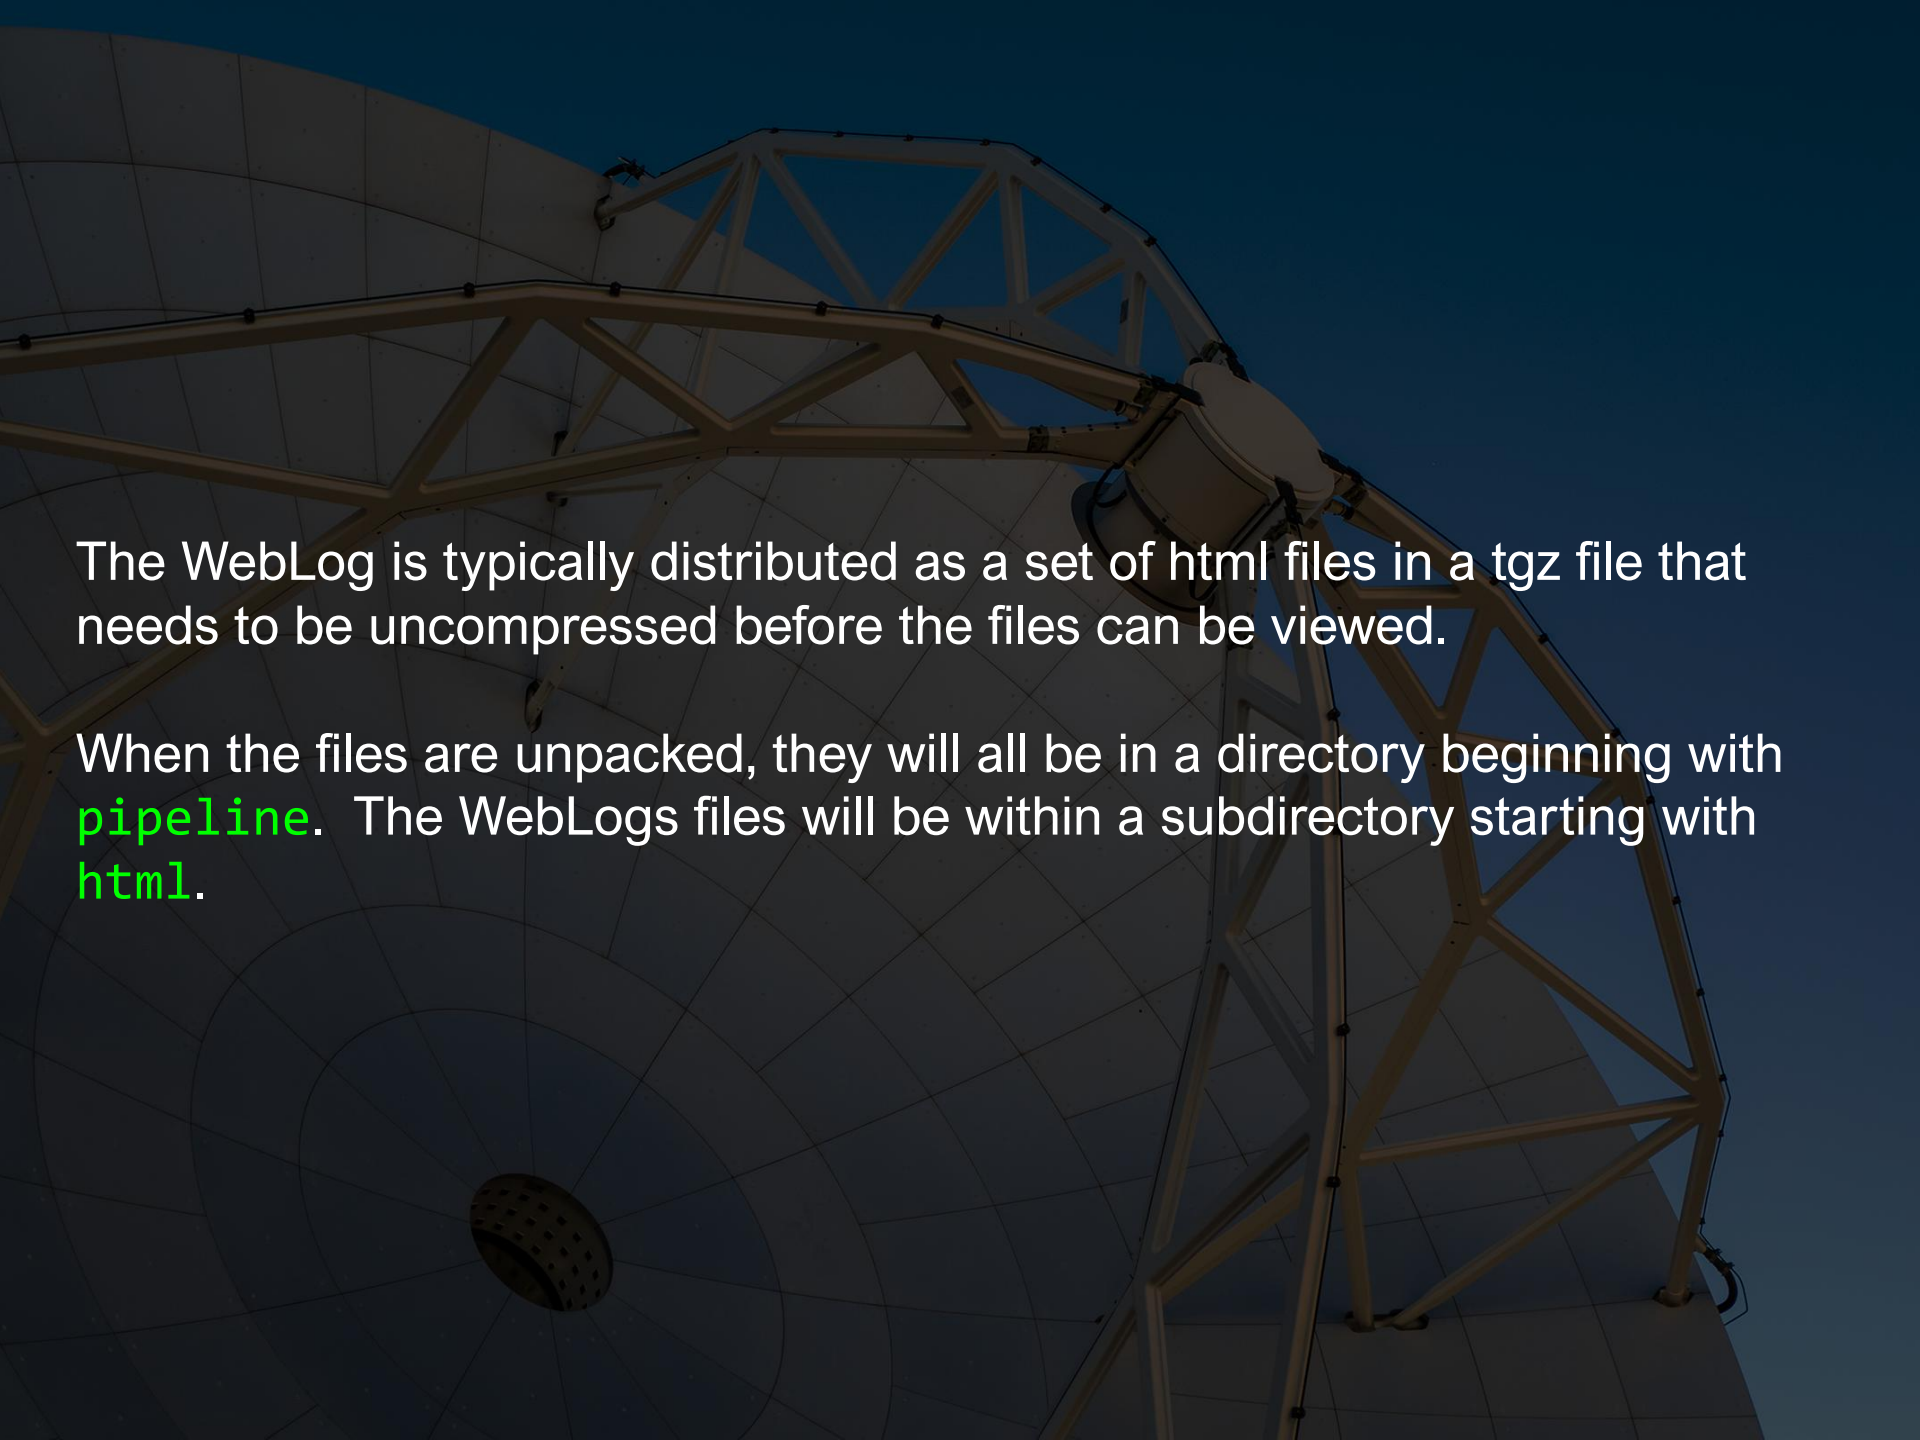

This is produced by the ALMA pipeline as the data are being calibrated and imaged.

The calibration part of the pipeline will calibrate the following in the visibility data:

- Phase versus frequency
- Amplitude versus frequency
- Phase versus time
- Amplitude versus time

The imaging pipeline produces the following:

- Image cubes
- Continuum flux images for each spw
- Aggregate continuum image for all spws

A large satellite dish antenna structure is shown against a dark blue sky. The dish is composed of a complex metal lattice of beams and supports. A circular antenna element is visible on the surface of the dish. The overall scene is dimly lit, suggesting dusk or dawn.

The WebLog is typically distributed as a set of html files in a tgz file that needs to be uncompressed before the files can be viewed.

When the files are unpacked, they will all be in a directory beginning with `pipeline`. The WebLogs files will be within a subdirectory starting with `html`.

Most web browsers may not open the WebLogs correctly because of issues with their security settings.

The current recommendation is to use the following steps to open a WebLog:

1. In a terminal, go to the `pipeline*/html` directory with the WebLog.
2. Start CASA in pipeline mode using the `--pipeline` option.
3. At the CASA prompt, type `h_weblog()`.
4. Copy the url printed by this command into the address bar of a web browser.

The main index (or Home) page provides an overview of the observations. The page has three tabs at the top. The Home tab is currently displayed. Clicking on a measurement set in the bottom table leads to a page with more detailed information about those data.

The WebLogs could be used primarily for three different purposes. Focus on the pages below for each of these purposes.

- To review the observations.
- To check the results of the calibration process and the quality of the data.
- To examine the preview images and get information for imaging.

The overview page lists a lot of basic information about the observations themselves.

SOURCE]
```

The intent versus time plot shows the sequence of the observations as well as the purpose of those observations. Some observations have multiple purposes.

The field versus time plot is similar except that the y-axis indicates the field ID. In this case, 0 is field for the bandpass calibrator, 1 is the field for the phase calibrator, and 2 is the field for the science target (Z CMa).

The antenna setup page shows the location of the antennas and the resulting uv coverage (which is related to the final angular resolution and maximum recoverable scale of the data).

Antenna Details

ID	Name	Pad	Diameter	Offset from Array Centre	
				Longitude	Latitude
0	DA41	A004	12.0	52.7 m	-704.4 m
1	DA42	A047	12.0	38.5 m	-775.2 m
2	DA43	A006	12.0	79.0 m	-702.1 m
3	DA44	A044	12.0	-22.0 m	-761.0 m
4	DA45	A040	12.0	15.7 m	-758.5 m
5	DA46	A001	12.0	24.2 m	-693.4 m
6	DA47	A040	12.0	99.4 m	-754.5 m

The sky setup shows the elevation and azimuth of the fields during the observations. The beam for sources observed at low elevations ($<45^\circ$) could appear elongated. Calibration problems may occur if the phase calibrator and science target are too far apart ($>10^\circ$).

To check the results of the calibration process and the quality of the data, go to the By Topic tab and the following listed under the By Task tab:

- hifa_tsysflag
- hifa_bandpass
- hifa_spwphaseup
- hifa_timegaincal
- hifa_applycal

Some of the other tasks also produce figures or tables with information about the quality of the data that may be useful for more advanced users.

If any problems appear in the data and the problems are not corrected by the pipeline calibration, the `flagdata` command can be used in CASA to flag the data (which will indicate that the data should not be used in imaging). See the example below to flag the data for spw 27 from antenna DA59.

```
flagdata(vis='example.ms',  
         mode='manual',  
         antenna='DA59',  
         spw='27',  
         flagbackup=False)
```

If very severe problems are found in the WebLogs, especially problems affecting multiple antennas, it would be appropriate to submit a Helpdesk ticket to ask about the problem.

The By Topic page lists warnings that were produced by the pipeline along with grades for those warnings and tables showing the amount of data flagged for each antenna in each field. This page is more important for reviewing the quality of the data.

The By Task page lists each of the calibration and imaging steps that were applied in the pipeline. Not all of these steps need to be checked. Many of these have diagnostic information primarily used for quality assessment.

2022.1.00401.S - Task Summaries - Google Chrome

2022.1.00401.S

Task Summaries

Task	QA Score	Duration
1. hifa_importdata : Register measurement sets with the pipeline	 1.00	0:02:16
2. hifa_flagdata : ALMA deterministic flagging	 1.00	0:10:37
3. hifa_fluxcalflag : Flag spectral features in solar system flux calibrators	 1.00	0:00:02
4. hif_rawflagchans : Flag channels in raw data	 1.00	0:02:49
5. hif_refant : Select reference antennas	 1.00	0:00:13
6. h_tsyscal : Calculate Tsys calibration	 1.00	0:03:43
7. hifa_tsysflag : Flag Tsys calibration	 1.00	0:05:06
8. hifa_antpos : Correct for antenna position offsets	 1.00	0:00:02
9. hifa_wvrgcalflag : Calculate and flag WVR calibration	2.07x improvement  0.87	0:04:42
10. hif_lowgainflag : Flag antennas with low gain	 1.00	0:06:48
11. hif_setmodels : Set calibrator model visibilities	 1.00	0:03:14
12. hifa_bandpassflag : Phase-up bandpass calibration and flagging	 0.96	0:15:34
13. hifa_bandpass : Phase-up bandpass calibration	 1.00	0:16:46
14. hifa_spwphaseup : Spw phase offsets calibration	 1.00	0:02:09
15. hifa_gfluxscaleflag : Phased-up flux scale calibration + flagging	 1.00	0:03:03
16. hifa_gfluxscale : Transfer fluxscale from amplitude calibrator	 1.00	0:07:38
17. hifa_timegaincal : Gain calibration	Phase offsets: insufficient data  0.85	0:23:15
18. hifa_targetflag : Target outlier flagging	 1.00	0:03:41

hifa_tsysflag: This step includes plots of the T_{sys} data (used to correct amplitudes) as a function of frequency. It is useful to check these plots to understand the atmospheric transmission. Spectral features in these data could potentially reappear in the final spectra of the science targets.

Diagnostic plots

Phase vs time

These diagnostic plots show the phase solution for a calibration generated using a short solution interval (in the case of the checksource(s), they are taken from the tables generated by hifa_gfluxscale). In case of very low SNR on a particular phase calibrator or check source (if present), solutions averaged in time with a solint = 1/4 the scan time are shown for that field. This calibration is not applied to the target. One plot is shown for each non-combined spectral window, with phase correction plotted per antenna and correlation as a function of time.

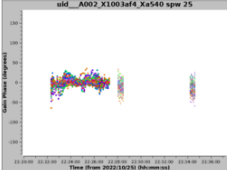

Click the summary plots to enlarge them, or the spectral window heading to see detailed plots per spectral window and antenna.

[uid__A002_X1003af4_Xa540.ms](#)

Spectral windows default mapped for J1820-2528 (PHASE).

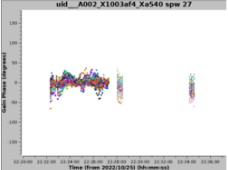

Plots show the diagnostic phase calibration for uid__A002_X1003af4_Xa540.ms.

Spectral window 25

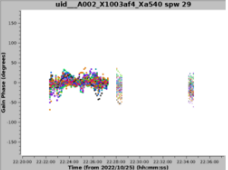

Phase vs time, all antennas and correlations.

Spectral window 27

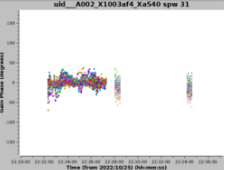

Phase vs time, all antennas and correlations.

Spectral window 29

Phase vs time, all antennas and correlations.

Spectral window 31

Phase vs time, all antennas and correlations.

Phase offsets vs time

These diagnostic plots show the phase offsets as a function of time. The phase offsets are computed by preapplying an spw-combined phase-only solution to the phase calibrator data and computing a new phase solution for each spw. The new phase solutions should scatter about zero with no drift. The points shown for the other calibrators will be zero. The new solutions are not applied to the target. One plot is shown for each spectral window, with phase offset plotted per antenna and correlation as a function of time.

Click the summary plots to enlarge them, or the spectral window heading to see detailed plots per spectral window and antenna.

19. Apply calibration tables

QA Score: 1.00 For uid__A002_X1003af4_Xa540.ms, intent(s): TARGET, 2.19% of the data was newly flagged by applycal flagging agents, for a total of 6.96% flagged. [All QA Scores \(3 green\)](#)

This task applies all calibrations registered with the pipeline to their target measurement sets.

Contents

- Applied calibrations
- Flagged data after calibration application
- Plots
 - Calibrated amplitude vs frequency
 - Calibrated phase vs frequency
 - Calibrated amplitude vs UV distance
 - Calibrated amplitude vs time
 - Calibrated phase vs time
 - (Corrected amplitude / model) vs antenna
 - (Corrected amplitude / model) vs UV distance
 - Science target: calibrated amplitude vs frequency
 - Science target: calibrated amplitude vs UV distance
 - UV coverage

Applied calibrations

The *Fields* column lists fields within the measurement set containing any of the intents listed in the *Intents* column. If a field name is ambiguous and does not uniquely identify a field, e.g., when a field is observed with multiple intents, then the unambiguous field ID is listed instead of the field name. The order of entries in the *Fields* and *Intents* columns has no significance.

Measurement Set		Target				Calibration					
Name	Final Size	Intent	Fields	Spw	Antenna	Type	spwmap	gainfield	Interp	calwt	table

24. Image Pre-Check

QA Score: 1.00 Predicted robust=0.5 beam is within the PI requested range

Goals From OT:

Representative Target: PN_Hb_5
 Representative Frequency: 230.5595 GHz (SPW 27)
 Bandwidth for Sensitivity: 2.307 MHz (rounded to nearest integer #channels (5), repBW = 2.441 MHz)
 Min / Max Acceptable Resolution: 1.17 arcsec / 1.76 arcsec
 Maximum expected beam axial ratio (from OT): 1.5
 Goal PI sensitivity: 8.57 mJy
 Single Continuum: False

Estimated Synthesized Beam and Sensitivities for the Representative Target/Frequency

Estimates are given for four possible values of the tclean robust weighting parameter: robust = 0.0, +0.5 (default), +1.0, and +2.0. If the "Min / Max Acceptable Resolution" is available (>=Cycle 5 12-m Array data), the robust value closest to the default (+0.5) that predicts a beam area (defined as simply major x minor) that is in the range of the PI requested beam area according to the table row for repBW (Bandwidth for Sensitivity) is chosen. If none of these robust values predict a beam area that is in range, robust=+2.0 is chosen if the predicted beam area is too small, and robust=0.0 is chosen if the predicted beam area is too large. The chosen robust value is highlighted in green and used for all science target imaging. In addition to an estimate for the repBW, an estimate for the aggregate continuum bandwidth (aggBW) is also given assuming NO line contamination but accounting for spw frequency overlap. If the Bandwidth for Sensitivity (repBW) is > the bandwidth of the spw containing the representative frequency (repSPW), then the beam is predicted using all spws, otherwise the beam is predicted for the repSPW alone. A message appears on the "By Task" view if a non-default value of robust (i.e., not +0.5) is chosen. Additionally, if the predicted beam is not within the PI requested range using one of the four robust values, Warning messages appear on this page.

These estimates should always be considered as the BEST CASE SCENARIO. These estimates account for Tsys, the observed uv-coverage, and prior flagging. The estimates DO NOT account for (1) subsequent science target flagging; (2) loss of continuum bandwidth due to the hif_findcont process (i.e. removal of lines and other spectral features from the data used to image the continuum); (3) issues that affect the image quality like (a) poor match of uv-coverage to image complexity; (b) dynamic range effects; (c) calibration deficiencies (poor phase transfer, residual baseline based effects, residual antenna position errors, etc.). It is also important to note that both the repBW and aggBW beam calculations are intrinsically multi-frequency synthesis continuum calculations, using the relevant spws as described above. The synthesized beam for a single channel in a cube will typically be larger and can be significantly larger depending on the details of uv-coverage and channel width.

robust	uvtaper	Synthesized Beam	Cell	Beam Ratio	Bandwidth	BW Mode	Effective Sensitivity
0.0	[]	1.55 x 1.10 arcsec @ -77.8 deg	0.22 x 0.22 arcsec	1.41	2.441 MHz	repBW	0.00559 Jy/beam
0.0	[]	1.38 x 0.972 arcsec @ -82.6 deg	0.19 x 0.19 arcsec	1.41	5625 MHz	aggBW	9.57e-05 Jy/beam
0.5	[]	1.59 x 1.13 arcsec @ -78.1 deg	0.23 x 0.23 arcsec	1.41	2.441 MHz	repBW	0.00511 Jy/beam
0.5	[]	1.49 x 1.04 arcsec @ -82.5 deg	0.21 x 0.21 arcsec	1.41	5625 MHz	aggBW	8.42e-05 Jy/beam

hifa_imageprecheck: This module estimates beam sizes using different robust factors for imaging, which is useful to refer to when re-imaging the data. The row in green is selected for subsequent imaging steps.

Estimated Synthesized Beam and Sensitivity for the representative target frequency

Estimates are given for four possible values of the CLEAN robust weighting parameter: robust = 0.0, +0.5 (default), +1.0, and +2.0. If the "Min / Max Acceptable Resolution" is available (\geq Cycle 5 12-m Array data), the robust value closest to the default (+0.5) that predicts a beam area (defined as simply major x minor) that is in the range of the PI requested beam areas according to the table row for repBW (Bandwidth for Sensitivity) is chosen. If none of these robust values predict a beam area that is in range, robust=+2.0 is chosen if the predicted beam area is too small, and robust=0.0 is chosen if the predicted beam area is too large. The chosen robust value is highlighted in green and used for all science target imaging. In addition to an estimate for the repBW, an estimate for the aggregate continuum bandwidth (aggBW) is also given assuming NO line contamination but accounting for spw frequency overlap. If the Bandwidth for Sensitivity (repBW) is $>$ the bandwidth of the spw containing the representative frequency (repSPW), then the beam is predicted using all spws, otherwise the beam is predicted for the repSPW alone. A message appears on the "By Task" view if a non-default value of robust (i.e., not +0.5) is chosen. Additionally, if the predicted beam is not within the PI requested range using one of the four robust values, Warning messages appear on this page.

These estimates should always be considered as the BEST CASE SCENARIO. These estimates account for Tsys, the observed uv-coverage, and prior flagging. The estimates DO NOT account for (1) subsequent science target flagging; (2) loss of continuum bandwidth due to the hif_findcont process (i.e. removal of lines and other spectral features from the data used to image the continuum); (3) issues that affect the image quality like (a) poor match of uv-coverage to image complexity; (b) dynamic range effects; (c) calibration deficiencies (poor phase transfer, residual baseline based effects, residual antenna position errors, etc.). *It is also important to note that both the repBW and aggBW beam calculations are intrinsically multi-frequency synthesis continuum calculations, using the relevant spws as described above. The synthesized beam for a single channel in a cube will typically be larger and can be significantly larger depending on the details of uv-coverage and channel width.*

hif_findcont: This is where the pipeline creates initial image cubes and identifies continuum channels (although the identification is not always optimal). This is useful as a first look at the spectra, although re-imaging the data may be much more effective for identifying spectral lines.

QA Score: 1.00 MOM8 FC image for field PN_Hb_5 virtspw 27 has a peak SNR of 2.8452 and no significant flux histogram asymmetry. [All QA Scores \(2 green\)](#)

Image Details

Field	Spw
PN_Hb_5 (TARGET)	27 / X638243208#ALMA_RB_06#BB_2#SW-01

View other QA images...

centre / rest frequency of cube	230.5495GHz / 230.5380GHz (LSRK)
beam	1.60 x 1.15 arcsec
beam p.a.	-77.4deg
final theoretical sensitivity	5.1 mJy/beam
cleaning threshold	30 mJy/beam Dirty DR: 4.5e+02 DR correction: 3

hif_makeimages: Several steps near the end of the pipeline (for multiple different types of output images) have this name. These pages are useful for seeing an overview of the imaging results, particularly with regards to information like beam sizes and noise levels.

0	<p>Pb-corrected Image (mom8)</p>			

hif_selfcal: Data acquired from Cycle 10 onwards will contain several steps that perform self-calibration (but we have no examples we can show yet).

This task will examine whether it is possible to improve the S/N of the data using self-calibration. This will be indicated by metrics in a table in the output. This is good to check to determine whether self-calibration could be useful when manually calibrating a dataset.

If the S/N is improved, several additional `hif_makeimages` steps after `hif_selfcal` will contain additional images created using self-calibration.

As a final note, the visibility data created by the ALMA pipeline (or the manual calibration scripts in the archive) is designated as science ready. It can immediately be used for science.

However, the images from the ALMA Science Archive, including those shown in the WebLogs, are **NOT** considered to be science ready. They can be used as a quick look at the data or making initial measurements but should not be used for making final measurements.
